## 1 Introduction

### 1.1 Preliminary trade-off of Menu elaboration

In line with the food processing activity, menu elaboration will also include 2 repeats of the proposed trade-off.

The aim of the menu elaboration activity is twofold:

- provide recipes / meals with balanced nutritional content
- ensure that the proposed meals are appreciated by the consumer

#### 1.1.1 6100 Menu elaboration strategy plan

##### 1.1.1.1 Approach

As the proposed strategy is to combine the harvested products (40% of the crew needs on dry weight basis) with 60% of resupply food, an assessment will be made first to determine which food components can be substituted with harvest derived products (from the same plant species), taken into account limitations on processing abilities established under WP5100.

Nutritional requirements will be met by an iterative calculating and adjusting of the ingredients of a menu. The calculation ability of the MELiSSA food database, as defined or refined under WP 3320 and WP3330 will be applied for this task, possibly in conjunction with other available database tools.

The protein quality of the obtained recipes will be determined, according to aminograms per cultivar. The aminogram summarizes the pattern of (essential) amino acids present in a substance.

The analytical procedures employed will be harmonised with existing European /international standards (AOAC Methods).

Based on the trade-off developed during task 3320, the menu rotation cycle will be defined and the menus needed will be composed based on data gathered in the MELiSSA food database.

Regardless of the length of the menu rotation cycle, preparation and organoleptic evaluation of the menu will be limited to a few example dishes prepared with a large share of the harvested products. The amount harvested will most likely limit also the number of identical dishes that can be prepared.

The evaluation of the menus will be based on a preliminary sensory evaluation by use of a small volunteer test panel to be defined, that will rate the consumed dishes according to a defined set of criteria.

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

In later stages of the project, the menu evaluation will be expanded to encompass a whole menu rotation cycle. To realize this, possibilities for synchronization with ongoing research projects will be evaluated.

### *1.1.1.2 Critical points*

It is important to define which products of current (ISS) spacefood would be replaced with products derived from the 4 cultured cultivars (e.g. replacing dairy products with soybean-derived products), in order to avoid substitutions that would lead to suboptimal levels of nutrients and minerals of primordial importance in space (e.g. calcium).

### **1.1.2 Tests**

In the case of database-derived menu selection, the performance of the tests will be limited to the validation of the obtained results and identification of possible critical points from a nutritional point of view – taking into account specific nutritional requirements for space programmes [e.g. RD2].

The proposed small-scale sensory evaluation will be carried out at least once.

The MELiSSA diet, defined by the 40% dry mass derived from 4 crops, and depending on the following factors: cultivar selection, food processing, preparation, new recipes elaboration and menu cycle definition, needs to be tested for acceptability from a sensory viewpoint.

Given the small scale of the crop growth tests and due to the virtual absence of an indicator on repeatability or reliability of the current plant growth experiments, it is logically impossible to already plan to incorporate these new menus into a bed-rest study or into a test evaluation in the ISS.

IPL will create a small panel of people to test this diet during a period to be defined. These people will be selected according to criteria to be elaborated. Selection criteria will include: healthy adults with a normal body mass index, history of a vegetarian diet, etc..

During this test IPL will study and process the panel responses made on specific evaluation forms which will have the following scoring parameters per meal.

### **1.1.3 Evaluation**

The used selection method/plan will be reviewed after the first trial (dishes incorporating processed products from reference harvest samples) and refined for application during the second test (dishes prepared with inclusion of crop harvest grown under controlled environmental conditions).

## 2 Nutritional evaluation of MELiSSA Menu

### 2.1 Introduction

The methodology to create a MELiSSA menu is developed in TN 98.3.32. To meet the specific nutritional requirements for astronauts in accordance with Annex 12 of TN 98.1.1, we have developed the principle of the food pyramid. These are guidelines for conducting a food choice and frequency to match the requirements. Thus, in the annex 4 in TN98.3.32 we have established a frequency of consumption for each food family. We have also, on the basis of these frequencies, and based on recommended intakes and amounts generally consumed by the European population, determined a quantity of each MELiSSA food group. These quantities have been introduced in a nutritional calculation software, Nutrilog version 2.10c. The database used is essentially the table of food composition Souci-Fachmann-Kraut 2010. This table from Germany is a reference in Europe. This food composition table is exhaustive both on the number of foods and the number of nutrients analyzed. All analyses are in accordance with AOAC methods. However, some food was missing in the Souci table. For those cases we completed the table with the American food composition table USDA SR 22. For some preparations of soybean, we completed the table with values provided by manufacturers specializing in soy products. Because we don't obtain sufficient amount of soy products, we use commercial soy products to create the first MELiSSA recipes. Thus, based on the amounts recommended for monthly consumption, and with the calculation software Nutrilog, we are able to assess the nutritional performance of a MELiSSA menu. In Table 2 – 4, we can find the calculated values compared to the recommendations. In chapter 2.3 we will discuss the results of these calculations.

### 2.2 Menus MELiSSA

#### 2.2.1 *Description of the menu*

At this stage, nutritional composition data of the first MELiSSA harvests have not yet been taken into account.

We only took nutritional information of raw MELiSSA plants (Wheat, Soybean, potato and rice) and some preparations such as soy “milk” (juice), bread, pasta, ...

In this plan MELiSSA recipes are not included because they require additional calculations and experiments . Table 2 shows for every meal the amount of MELiSSA food proposed in accordance with defined frequencies.

**Table 4 : nutritional intake for MELiSSA menus (one day average )**

Nutritional intake				
Energy	Intake	% TEI	Additional information	g/kg
Energy	1425 kcal		Energy expenditure : 3000 kcal	
Proteins	56 g	15.7%		0.8
Fat	18 g	11.3%	of which 15.4-25.7-41.9% are SFA - MUFA - PUFA adding up to 1.7-2.9-4.7% of TEI	
Carbohydrates	263 g	73%	of which 6.6% are simple carbohydrates adding up to [2)% of TEI	3.75
Alcohol	0 g	0%		

Vitamines	Intake	% avail (a).
Vitamin A, RE	12.21 µg	18%
Retinol (preformed vitamin A)	0 µg	50%
Vitamin D; All vitamin D (D <sub>2</sub> , D <sub>3</sub> ) by summation (calciferol)	0 µg	5%
Vitamin E	5.42 mg αTE	68%
Vitamin K	22.54 µg	50%
Vitamin C, total ascorbic acid	45.93 mg	59%
Thiamin (vitamin B-1; aneurin)	1.47 mg	86%
Riboflavin (vitamin B-2)	0.76 mg	86%
Niacin (nicotinic acid; nicotinamide; vitamin PP)	17.46 mg	86%
Pantothenic acid (D-pantothenate; vitamin B-5)	4.66 mg	86%
Vitamin B-6, total; method of determination unknown	1.57 mg	86%
Biotin (vitamin H)	10.46 µg	27%
Folate, total (folacin; folic acid; vitamin B9)	222.58 µg	86%
Vitamin B-12 (cobalamin)	0.40 µg	64%

Minerals	Intake	% avail.
Sodium	1516.30 mg	100%
Potassium	2483.95 mg	100%
Calcium	501.97 mg	100%
Phosphorus	1258.32 mg	100%
Magnesium	511.50 mg	100%
Iron, total	12.51 mg	100%
Zinc	7.77 mg	100%
Selenium	62.48 µg	64%
Copper	1.56 mg	86%
Manganese	6.94 mg	86%

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation

Chromium	6.68 µg	9%
Iodide (iodine)	7.29 µg	27%
Molybdenum	63.19 µg	36%
Fluoride (fluorine)	35.50 µg	18%

Others	Intake	% avail.
Fatty acids, total saturated	2.8 g	82%
Fatty acids, total monounsaturated	4.7 g	73%
Fatty acids, total polyunsaturated	7.6 g	73%
Cholesterol; method of determination unknown	0 mg	64%
Sugars, total	17.2 g	45%
Fibre; method of determination unknown	30.2 g	91%
Water (moisture)	777 g	100%
Leucin	3152.13 mg	73%
Isoleucin	1759.12 mg	73%
Valin	2056.99 mg	73%
Histidin	910.49 mg	73%
Lysin	1455.32 mg	73%
Threonin	1446.85 mg	73%
Tryptophan	540.40 mg	73%
Methionin	679.48 mg	73%
Phenylalanin	2006.19 mg	73%

a) % avail. : means percentage of available nutritional information on the food database. (e.g. : for fluoride : due to lack of information we have only 18% of nutritional information)

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	
This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP	

### 2.3 Discussion of results

Explanation of the term ‘xx% of nutritional information available’ which is mentioned for several elements below:

In the menu numerous ingredients are used. For some ingredients nutritional information on macro and micronutrients is available. But for some nutrients the food composition table indicates a blank.

The percentage of nutritional information available means that for example:

- (1) If we have 10 different ingredients and we have information for e.g. Iron for all of these ingredients, the nutritional information for Iron will be 100%.
- (2) If for example we have information for Iron for only one ingredient out of these 10, the nutritional information will be 10%.

This number is important to evaluate the impact on the results.

If we have a low percentage of nutritional information we have 2 possibilities:

- (1) All ingredients are not a real source for this specific nutrient. So we can evaluate that the final result is close to the total amount calculated for this nutrient.
- (2) Some ingredients can be a potential source of this nutrient, so we have to determine the exact amount by using other food composition tables or by analysing the nutrient ourselves.

Remark: The percentage we use is based on the number of ingredients used in the menu. Another approach could be to evaluate the percentage of nutritional information based on the amount of ingredients used in the menu. For example:

- (1) If we evaluate potato in a recipe like mashed potatoes, potato is one of 6 ingredients. In this case if we have no indications for one nutrient the results will be based on 1/6.
- (2) If we would use the percentage of potatoes used (80% of potatoes in the recipe for mashed potato), the result would be based on this 80%.

#### 2.3.1 Energy

Estimated Energy Requirements for astronauts are about 3,000 kcal on a daily basis. This represents the basic needs and should be increased depending on the particular physical activities associated with EVA. Estimated Energy requirements for women are lower due to reduce body weight and lean body mass.

MELiSSA menu provided in the order of 1425 kcal (5962 kJ) or 47.5% of total energy needs. This represents 20,3 kcal / kg body weight.

The main sources of energy in this menu are bread, pasta, potatoes, rice, wheat, bran and breakfast cereals.

If we add energy from fat (MELiSSA oil), we can increase the intake with 430 kcal.

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	<p>This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization</p> <p>Memorandum of Understanding 19071/05/NL/CP</p>

Energy requirements are :

**Men: < 30 years :  $1.7 * (15.3 * \text{weight} + 679)$**

**Men: > 30 years :  $1.7 * (11.6 * \text{weight} + 879)$**

**Women: < 30 years :  $1.6 * (14.7 * \text{Weight} + 496)$**

**Women: > 30 years :  $1.6 * (8.7 * \text{Weight} + 829)$**

**Example :**

**Men : 70 kg < 30 years : = 2975 kcal**

**Men : 70 kg > 30 years : = 2875 kcal**

**Women : 56 kg < 30 years : = 2110 kcal**

**Women : 56 kg > 30 years : = 2105 kcal**

### 2.3.2 Protein

protein intake is estimated at 56g a day equalling 0,77g per kilogram body weight of an astronaut.

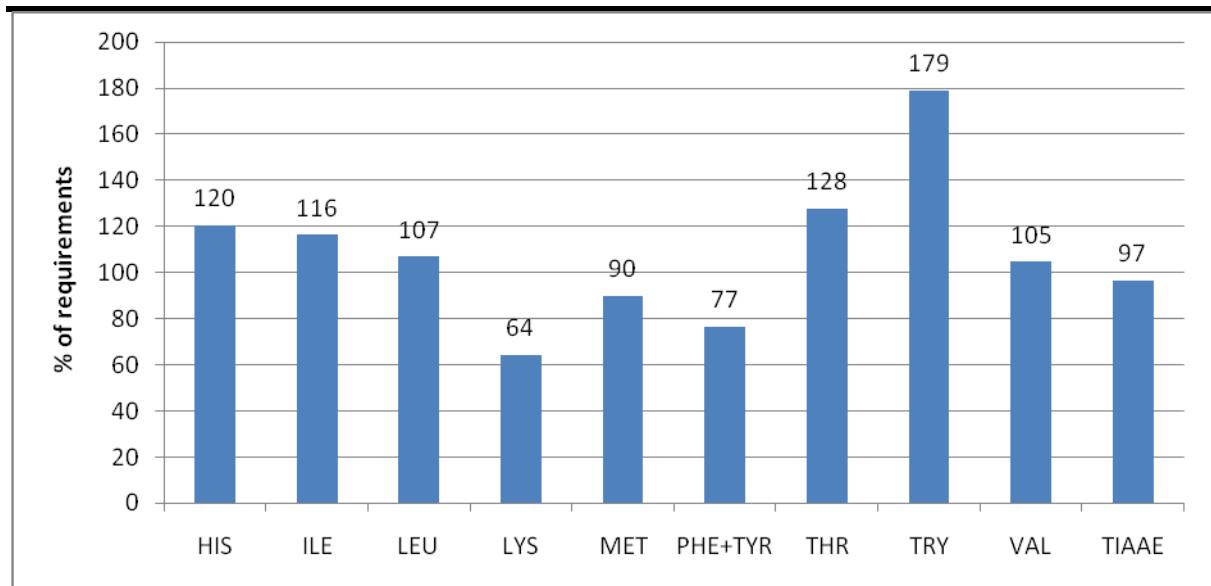

This represents only vegetable proteins sources. To complete the protein requirements, it will be necessary to envisage supplementary provisions by resupplied food.

### 2.3.3 Indispensable amino acids

In Figure 1, we note that the MELISSA menu does not cover the needs of certain amino acids. In most cases for lysine and methionine. Regarding phenylalanine and tyrosine intake, the problem is situated at the level of the food composition table which lacks information on tyrosine.

We expected these results given the fact that vegetables proteins sources are limited in certain amino acids. Table 5 shows vegetable food sources and their risk of amino acids deficiencies. However this value must be corrected by the Protein Digestibility factor using the Corrected Amino Acid Score method (PDCAAS) (Table 6)

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

**Figure 1 : Amount of amino acids compared to requirements express in percent of mg of amino acids per kilo for an astronaut of 73 kg.**

**Table 5 :Limiting amino acid in vegetables sources**

	Limiting amino acid		% of deficit
	First	Second + third	
<b>Wheat</b>	Lysine	threonine + isoleucine	61
<b>Soybean</b>	Methionine	Cysteine	50
<b>Potato</b>	Methionine	Cysteine	59
<b>Rice</b>	Lysine	threonine + isoleucine	45
<b>Peanut</b>	Methionine	Cysteine	50

**Table 6 : Protein Digestibility using Corrected Amino Acid Score method (PDCAAS)**

<b>Soy protein isolate</b>	1
<b>Soy bean</b>	0,91
<b>Whole wheat</b>	0,54
<b>Peanuts</b>	0,52
<b>Rice</b>	0,47

PDCAAS is a combination of the chemical score of the limiting amino acid multiplied by true digestibility of the protein. A PDCAAS value of 1 is the highest, and 0 the lowest

### 2.3.4 Histidine

910 mg or 16,25 mg/g of proteins (expected amount 15 mg) or 13 mg/kg for a astronaut  
(Expected amount is 10 mg)

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	
This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization	
Memorandum of Understanding 19071/05/NL/CP	

### 2.3.5 *Isoleucine*

1759 mg or 31,41 mg/g of proteins (expected amount 30 mg) or 25,13 mg/kg for a astronaut  
(Expected amount is 20 mg)

### 2.3.6 *Leucine*

3152 mg or 56,28 mg/g of proteins (expected amount 59 mg) or 45,02 mg/kg for a astronaut  
(Expected amount is 39 mg)

### 2.3.7 *Lysine*

1455 mg or 25,98 mg/g of proteins (expected amount 45 mg) or 20,78 mg/kg for a astronaut  
(Expected amount is 30 mg)

As expected this value is low.

### 2.3.8 *Methionine*

679 mg or 12,12 mg/g of proteins (expected amount 16 mg) or 9,7 mg/kg for a astronaut  
(Expected amount is 10 mg)

As expected this value is low.

### 2.3.9 *Phenylalanine and Tyrosine*

2006 mg or 35,82 mg/g of proteins (expected amount 38 mg) or 28,65 mg/kg for a astronaut  
(Expected amount is 25 mg).

We don't have more information about the amount of Tyrosine in our tables.

### 2.3.10 *Threonine*

1446 mg or 25,82 mg/g of proteins (expected amount 23 mg) or 20,65 mg/kg for a astronaut  
(Expected amount is 15 mg)

### 2.3.11 *Tryptophane*

540 mg or 9,64 mg/g of proteins (expected amount 6 mg) or 7,71 mg/kg for a astronaut  
(Expected amount is 4 mg)

### 2.3.12 *Valine*

2056 mg or 36,71 mg/g of proteins (expected amount 39 mg) or 29,37 mg/kg for a astronaut  
(Expected amount is 26 mg)

### 2.3.13 *Total Indispensable amino acids*

14780 mg or 263,92 mg/g of proteins (expected amount 277 mg) or 211,14 mg/kg for a astronaut  
(Expected amount is 184 mg)

### 2.3.14 *Carbohydrates*

263 g per day or 35% TEE or  $3,75\text{g} \cdot \text{kg}^{-1} \cdot \text{d}^{-1}$   
Requirements **50 – 55 (45 – 65) or 4 – 6  $\text{g} \cdot \text{kg}^{-1} \cdot \text{d}^{-1}$**

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	
This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP	

This amount of carbohydrates is well represented by the 2 basic foods (wheat (bread, pasta, ...) and potatoes). Other foods such as rice supplement the diet.

This contribution corresponds to the expectations and therefore we can estimate that these menus provide enough complex carbohydrates. The portion of starchy food provided by the spacefood resupply will be limited.

### **2.3.15 Added Sugar**

Sugars 16,7 g or 6.6% are simple carbohydrates adding up to 2% of TEI. Requirements are < 10% of TEI

It is normal that this value is low because simple sugars are not present in the MELiSSA ingredients.

Sucrose is nevertheless an essential ingredient for numerous recipes. Thus, sweet taste will be brought from Earth. However, as indicated in the Annex TN 98.1.1, sugar needs to be limited due to disturbances in blood glucose and risk of dental problems.

### **2.3.16 Total fibre**

Fibre intake is about 30,2 g. Just on the requirements (> 30g). We can see that the contribution is mainly provided by cereals implying that the contribution is mainly in the form of insoluble fibres. With this kind of fibres, some people may experience heaviness or digestive difficulties. It is important to elevate slowly this amount. Especially after a travel of six months in a spacecraft, and eating ‘spacefood’ generally low in dietary fibres.

### **2.3.17 Fat**

Intake of 18 g per day or 5,4 % of TEI (3000kcal). This is less than the requirements (requirements: 20-35 % of TEI). If we plan to add fat in the menu we can use oil of MELiSSA origin, this coming from soybean, wheat or rice. We can estimate to provide about 20 % of TEI this way. The rest will come from spacefood. The quality of this added fat must be defined in quality of the fatty acids content to avoid excess of saturated fatty acids.

### **2.3.18 Fatty acids**

Intakes of fatty acids are in the order of 1.7 % of TEI for saturated fatty acids (SFA), 2.9 % for mono-unsaturated fatty acids (MUFA) and 4.7 % of TEI for poly-unsaturated fatty acids (PUFA)

As for the total lipids amount, it is normal to obtain in this case low intakes of fatty acids. By envisaging the addition of soy, wheat and rice oil, we will be able to raise the intakes of MUFA and PUFA. PUFA and MUFA are the most interesting fatty acids but also the most sensitive to ionizing radiance.

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

### **2.3.19 Fluid**

Intake of water in the form of water contained in food and metabolic water provide 777 ml per day, this is lower than the needs (Requirements: 1-1.5ml per kcal intake, minimum 2000 ml / day). This is not included in drinking water.

The needs increase in case of an increased physical activity (e.g. EVA) or in case of elevated temperature.

### **2.3.20 Calcium**

Intake of 501,97 mg per day. Requirements are 1200 mg per day for men and women, with a maximum of 2500 mg per day.

As expected, intakes of calcium are low and cover less than half of the daily needs. MELiSSA ingredients are not considered to be interesting sources of calcium. Moreover, soy milk and whole wheat represent another problem as it is important to take into account risks of formation of insoluble complexes in the presence of phytic acid.

### **2.3.21 Phosphorus**

Intake of 1258,32 mg per day. Requirements are 800 mg per day for men and women, with a maximum of 4000 mg per day.

Phosphorus intake is very important and principally provided by soybean. Low intake will induce a low calcium / phosphorus ratio of 0.3 while recommendations are superior to 1. It will increase the risk of bone dissolution and enhance the possibility of kidney stone formation.

### **2.3.22 Magnesium**

Intake of 511.50 mg per day. Requirements are 260 – 420 mg per day for men and 220 – 320 mg per day for women with a maximum of 3500 mg per day.

Intakes of magnesium are widely covered due to the utilization of whole grain products only. Depending on the processing technologies used, it is possible that these amounts diminish e.g. refining or dilution.

### **2.3.23 Sodium**

Intake of 1516.30 mg per day. Requirements are 2000-2500 mg per day for men and 2000-2500 mg per day for women with a maximum of 3500 mg per day.

Sodium intakes does not take into account possible additions of salt during preparations, or the use of added salt spices, or the addition of salt at the table.

Intakes are important. Main sodium sources in the menu are bread, breakfast cereals and soy products. Indeed, bread is generally too much salted. In MFC2, we expect to use whole-wheat

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

bread with a reduced salt content and enhanced kneading time. This last point can enhance organoleptic qualities.

It is primordial not to add too much salt in the food. An excess of salt may enhance the risk of calciuria and lead to bone decalcification and increased risks of kidney stones.

Salt is used by manufacturers to improve taste of recipes and to raise the preservation time.

It will be necessary to restrict salt addition in processed spacefood products.

The improvement of the taste for many MELiSSA recipes will be the result of an utilization of herbs and non salted spices instead of salt.

### **2.3.24 Chloride**

Intakes of Chlorine are not really evaluated by nutritional databases. They have a low impact on health. The majority of chlorine is brought by the presence of sodium chloride. Recommendations are of 3000-3800 mg per day for the men and women respectively with a maximum of 5400 mg per day.

### **2.3.25 Potassium**

Intake of 2483.95 mg per day. Requirements are 3000 – 4000 mg per day respectively for men and women. There is no upperlimit described for the intake of potassium.

In the MELiSSA menu, the main sources of potassium are whole-wheat bread, thanks to the presence of the bran, soy products and potatoes. Thanks to MELiSSA ingredients, we can expect a supply of 2/3 of the necessary intake.

### **2.3.26 Iron**

Intake of 12.51 mg per day. Requirements are 10 mg per day for men and 19.6 for women. With a maximum of 45 mg per day.

Iron intake seems to correspond to the needs for men. For women, needs are higher due to menstrual losses. In that case, it will not be possible to cover the iron needs with MELiSSA food only. Besides, MELiSSA food is not considered a good iron source. Indeed, MELiSSA sources for iron are: whole-wheat bread, , spirulina. In this simulation we used commercial nutritional informations based on enriched corn flakes and enriched soy products . However, in the MELiSSA menu, iron is available under the non-heminic form of. This kind of iron is less tolerated and less absorbing than heminic iron. Moreover, whole-wheat grain contains some phytic acid and this can form not absorbable and insoluble complexes with non-heminic iron. Iron will have to be provided through Spacefood, in the form of food rich in heminic iron sources like meat and meat products. The use of iron supplements can be envisaged but several elements note that we have to be prudent.

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

---

Important doses of iron supplements can raise risks of digestive discomfort, oxidation of tissue, cardiac failure, cancers, hemochromatose, and even more if it is linked to high doses of vitamins C.

### 2.3.27 Copper

Intake of 1.56 mg per day (86% of nutritional information available). Requirements are 1.5-3.0 mg per day per day for men and women with a maximum of 5.0 mg per day.

In the MELiSSA menu, the intake of copper is mainly covered by the quantities of whole-wheat bread and soy products. Supplements with food of animal origin will allow to provide optimum quantities.

### 2.3.28 Manganese

6.94 mg (86% of nutritional information available). Requirements are 2.0 mg per day for men and women with a maximum of 5.0 mg per day.

Manganese is principally provided by whole grains. In the case of the MELiSSA menu, bread covers a large part of the intake.

### 2.3.29 Fluoride

Fluoride intake of 35.50 µg (only 18% of nutritional information available). Requirements are 3 µg per day with a maximum intake of 10 µg per day.

Nutritional information on this element is rare , due to the lack of nutritional data for this element, we obtained only 18 % of nutritional information. According to the information we have, intake of fluoride seem to be broadly covered. In most cases by potatoes. During supplementary analyses in MFC2 it will be necessary to confirm this value. Other food composition tables do not mention values for this nutrient. If this value is confirmed, it will be necessary to examine the risks of excessive doses and consequences for the bone and dental health of the astronauts.

### 2.3.30 Zinc

Zinc intake of 7.77 mg per day. Requirements are 4.2 – 15 mg per day for men and 3 – 15 mg per day for women with a maximum of 40 mg per day.

Minimal zinc needs are covered, in most cases by not refined grain. This nutrient does not seem to pose a problem, given that the spacefood and more precisely meat and cheeses will provide supplementary intake.

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

### 2.3.31 Selenium

Selenium intake of 62.48 µg per day (64% of nutritional information available). Requirements for men are 70 µg per day and for women 60 µg per day with a maximum of 400 µg per day.

Intake of selenium is almost completely covered by the MELiSSA menu. However, these evaluations are based on values extracted from plants grown in normal culture and we hope on ground which is not depleted in selenium. In hydroponics culture, it is necessary to consider a selenium enrichment of the plant nutrient solutions. Even if plants do not require selenium for their growth, they can absorb and integrate it in an organic form. The absorption of organic forms is preferable.

### 2.3.32 Iodine

7.29 µg per day (27% of nutritional information available). Requirements for men and women are 150 µg per day with a maximum of 1100 µg per day

The available nutritional information on iodine is not sufficient to get a correct idea of the intake. However, the main source seem to be potatoes. To meet the minimum iodine intake, supplements of fish and marine products will be essential. In addition, the use of iodized salt is important. Even if we have reduced sodium intake, it is preferable to use iodized salt. The type of iodized salt must be defined.

### 2.3.33 Chromium

6.68 µg per day (only 9% of nutritional information available). Requirements are 35 µg per day for men and 25 µg per day for women with a maximum of 250 µg if given as supplement.

The nutritional information available for this element is low. Indeed we have only the chrome value for potatoes.

### 2.3.34 Molybdenum

63.19 µg per day (only 18% of nutritional information available). Requirements are 45 -50 µg per day for men and women with a maximum of 2000 µg per day

### 2.3.35 Vitamin A (*includes provitamin A carotenoids*)

12,21 µg per day (only 18% of nutritional information available). Requirements are 600-1000 µg per day for men and 500-1000 µg per day for women with a maximum of 3000 µg

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

Intake of vitamin A is naturally low because MELiSSA foods have a low fat content. Therefore this vitamin should be provided either by MELiSSA oil or must be included in spacefood.

### **2.3.36 Vitamin D (*calciferol*)**

The MELiSSA menu does not contain any vitamin D. So we obtain values close to 0 mg (5% of nutritional information). Requirements are 5-10 µg per day for men and women with a maximum of 50 mg per day. The risks of deficiencies are extremely important/high. Furthermore, the endogenic synthesis of vitamin D by UV are impossible in a space station or on a planetary surface. It is therefore essential to aim to provide the full vitamin D requirements by means of the in the 60% of spacefood. Vitamin A intake as a supplement is to study (dosis, way of administration, ...). Moreover, the stability of this vitamin can cause problems due to radiation.

### **2.3.37 Vitamin E (*a-tocopherol*)**

5,42 mg α-Tocopherol equivalent α-TE (68% of nutritional information). Requirements are 10-20mg for man and 7.5-20mg for women. Max : 1000 mg

The intake of vitamin E is mainly provided by whole wheat bread. However, the bioavailability of the vitamin depends on the grinding and the effort of chewing food by astronauts. Otherwise, the loss of this vitamin can be found in the feces. In case of the addition of MELiSSA oil, we can expect to meet the requirements.

### **2.3.38 Vitamin K**

22,54 µg per day (50% of nutritional information). Requirements are 65-120 µg per day for men and 55-90 µg per day for women. There is no maximum intake.

This fat-soluble vitamin is also found in the small amount of contained in grains. Thus, the levels found are provided by whole wheat, soybeans "milk" (juice), and potatoes. It is difficult to estimate the portion of vitamin K produced by bacteria in the astronaut's intestines.

### **2.3.39 Vitamin C (*ascorbic acid, dehydroascorbic acid*)**

45,93 mg per day (59% of nutritional information). Requirements are 75-100 µg per day with a maximum of 2000 mg per day.

Intake of vitamin C is lower than required. In addition, we need to give attention to the fact that this vitamin is sensitive to storage conditions, as well as cooking techniques. The same is true for spacefood products and / or food supplements. Thus, losses can be significant and the risk of deficiencies is high.

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	
This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP	

### **2.3.40 Vitamin B12 (cobalamin)**

0,40 µg per day (64% of nutritional information). Requirements are 2.4µg per day. There is no maximum uptake.

There is a risk of insufficiency for this vitamin if the diet is mainly plant-based. We must further study the presence of vitamin B12 in spirulina. Is the presence of Vit. B12 in Spirulina created by a spirulina synthesis or by a microbiobal pollution? This question remains open at present.

### **2.3.41 Vitamin B6 (pyridoxal, pyridoxine, pyridoxamine, 5'-phosphates (PLP, PNP, PMP)**

Intake of 1,57 mg per day (86% of nutritional information). Requirements are 1.3 – 2mg per day with a maximum of 100 mg per day

Requirements for this vitamin are covered by the MELiSSA menu.

### **2.3.42 Thiamin (B1; aneurine)**

Intake of 1,47 mg per day (86% of nutritional information). Requirements are 1.2 – 1.5mg per day for men and 1.1 -1.5 mg per day for women. There is no maximum defined.

Requirements for this vitamin are covered by the MELiSSA menu.

### **2.3.43 Riboflavin (B2)**

Intake of 0,76 mg per day (86% of nutritional information). Requirements are 1.3 – 2 mg per day for men and 1.1 – 2 for women. There is no maximum defined.

### **2.3.44 Folate**

Intake of 222,58 µg per day (86% of nutritional information). Requirements are 400 µg or more per day, with a maximum of 1000 µg per day.

A folate deficiency is created by the MELiSSA menu.. This could be solved by adding spirulina, spinach and cabbages to the menu. We should acquire large stocks to correspond to recommendations.

### **2.3.45 Niacin**

Intake of 17,46 mg per day (86% of nutritional information). Requirements are 16 – 20 mg per day for men and 14 – 20 mg per day for women with a maximum of 35 mg per day. Niacin needs seem to be covered.

IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

---

**2.3.46 Biotin**

Intake of 10.46 µg (only 27% of nutritional information). Requirements are 30µg per day. There is no maximum determined.

Needs are not covered. The lack of nutritional information of databases confirms that this vitamins is principally provided by food of animal origin.

**2.3.47 Pantothenic Acid**

Intake of 4,66 mg per day (86% of nutritional information). Requirements are 5 mg per day. There is no maximum determined.

Needs are practically covered for this vitamin.

**2.3.48 Choline**

We have no information for this nutrient. Requirements are 550 mg per day for men and 425 mg per day for women. There is no maximum defined.

**2.3.49 Arsenic**

We have no information for this nutrient. There are no requirements. There is no maximum defined.

**2.3.50 Boron**

We have no information for this nutrient. There are no requirements. There is no maximum defined.

**2.3.51 Nickel**

We have no information for this nutrient. There are no requirements. There is no maximum defined.

**2.3.52 Silicon**

We have no information for this nutrient. There are no requirements. There is no maximum defined.

**2.3.53 Vanadium**

We have no information for this nutrient. There are no requirements. There is no maximum defined.

IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

### **2.3.54 Inorganic sulphate**

We have no information for this nutrient. There are no requirements. There is no maximum defined.

## **2.4 Selection and development of recipes**

Based on mission objectives defined by the ESA, MELiSSA menus must represent a minimum of 40% of DW of the total diet during the stay on Mars. Based on MELiSSA plants (wheat, soybeans, potatoes, rice, lettuce, tomatoes, onions, spinach, kale and spiruline), we selected a first set of recipes based on different criteria:

- 1) a large proportion of MELiSSA plants and ingredients.
- 2) gourmet taste and gastronomic interest;
- 3) high nutritional value
- 4) simple realization
- 5) low food cost

Based on available recipes, cookbook references, input from the IPL recipes database and recipes from soy manufacturers or distributors, we realized a first list of recipes. These recipes are classified according to:

- 1) proportion of MELiSSA food (100%, more than 80%, 50%, more than 30%). We have also added a column in which MELiSSA ingredients are present only in small quantities. We believe that they can be essential to provide a balanced diet and a balanced recipes.
- 2) Another classification is based on the kind of menu components. Thus, classify recipes as an appetizer, main dish, the component of the main course, dessert, etc ... The goal is to provide a large number and diversified recipes to avoid any effect of lassitude.

Some are adaptations of classic recipes in which we propose to replace non MELiSSA plants by MELiSSA alternatives. For example mashed potatoes: the presence of cow milk involves milk powder, but the amount and the price to send milk powder into space will be prohibitive. Therefore, we propose to replace cow milk by soy "milk" (juice) which has comparable technological and nutritional qualities. However, the difference in taste can influence the final production and will be evaluated by a panel of tasters. In MFC2, we will integrate more European and regional recipes. (see annex 4 - 5.4)

In annex 9 of TN 98.3.33 we proposed an example of a MELiSSA recipe. In three pages, this representation gives us a good idea of all ingredients used, the process, the risk of allergy and nutritional information. (Table 7)

Waste	Weight
Water	600 ml
Food wastes	0 g

Additional information	
% of water evaporation during preparation	10 %
% of weight loss during preparation	0 %
% of fat soak	100 %

Additional information	
% of MELiSSA ingredients number (without spices)	100 %
% of MELiSSA ingredients weight (without spices)	100 %

## Preparation

**Bring water to boil.**

Clean and wash the potatoes.

Cut into two or four depending on the size.

Cook in boiling salted (5 %o) water for 15 minutes once water back to the boil.

Drain in a strainer and dry them in the pan.

Mash with potato masher.

Add hot soy milk and fat, mix well.

Season with pepper and nutmeg.

### Serve or cooling

### 3 Tasting

As part of a nutritional assessment, tasting meals is a useful tool. It helps to put into practice the elements that you want to improve. The tasting session is a sensory analysis that evaluates the quality of meals and their improvements. In sensory analysis, there are different types of testing [AFNOR] :

- a. The "test of differentiation" (comparison between different products)
- b. The "test description" (description of the intensity of sensory characteristics sample)
- c. The "consumer test" ("hedonic" analysis: assessing the level of preference)

The course of a tasting session must be supervised so that consumers are the most objective as possible and there are limited biases. The AFNOR (French Standards Association) established in his "Guide général pour la réalisation d'épreuves hédoniques en laboratoire d'évaluation sensorielle impliquant des consommateurs », the following instructions for tasting:

#### ***3.1.1 The steps to implement consumer tests (AFNOR XP V09-500) are summarized below:***

- a) Set the goals of the consumer test. You must have a clear vision of what you want:  
Selection of consumers? Qualities / product defects perceived by consumers? Hedonic product positioning on the market? Comparison of hedonic industrial products compared to traditional products? ...
- b) Panel Organization:
  - Consumers should not be recruited at the organising company for objectivity reasons. Consumer recruitment should correspond with the target of the representative market, selected on the basis of issues related to a decision tree.
  - Number: according to the objectives pursued, the panel will consist of 30 persons (Pre-test consumer business), 60 (test consumer base laboratory) or more than 100 people (test consumers with mapping preferences).
  - Instructions and conduct of meetings: no consumption of food or drinks 2h before the tasting (test environment morning / afternoon), no perfumes, silence during the tasting and the explanation of the conduct of tests and questionnaire, jury costs (maintaining motivation, punctuality, reliability, ...)
- c) Cabins for individual organization tests: avoid contact between people, neutral color (white), possibility of renting mobile booths, separated from the preparation area, temperature 20 ° C, relative humidity 70-85% ...

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

- 
- d) Sampling and presentation of products: representativeness of the lot, anonymity (in blind), 3-digit coding, uniform presentation, order of presentation different for each subject (3 products => 6 different orders of presentation), one order of presentation following another to avoid comparisons between products
  - e) Quiz: Simple (taste: sweet, strawberry, ...), simple rating scale (e.g. 1 = 'strong dislike' to 9 'I really like'), scale characterization (e.g. not enough - adequate - too ...), closed questions (avoid open questions)
  - f) Statistical data processing: ANOVA, Student matrix, correlations,
  - g) Graphical representation: A profile of acceptability (star), ACP, AFM, internal mapping preferences.
  - h) Data Interpretation

### **3.1.2 Development of sensory evaluation documents**

Here is a methodology for the preparation of documents for sensory evaluation:

- a) Stage Phase: Studying the population is essential to be in line with the target as much as possible.
- b) Study Phase Analysis: This phase involves analyzing the existing documents to create new, more complete documents thanks to past achievements.
- c) Development Phase: This is the "action", in which the sensory evaluation protocol is developed according to the information collected.
- e) Validation Phase: The protocol is tested in a practice session to see if it meets expectations and whether it can be used.
- f) Discount Phase: If needed the protocol is updated according to a change of objectives, target Studies etc.

## **3.2 The sensory analysis.**

Sensory analysis is defined as the examination of the organoleptic properties of a product by all sensing organs

### **3.2.1 Basic knowledge of physiology**

The sensory coding is the same for all the senses: the information is captured by a receptor cell. Initial treatment of the information is followed by its conversion into neurons that are sent to the brain for integration (interpretation?). Taste and smell are the two senses mainly involved in a sensory analysis. In our culture, five basic tastes that are perceived by the tongue are known, but there is no

TN 98.6.0	Preliminary trade-off of menu: test plan, test performances and test results evaluation
IPL	This document is confidential property of the MELiSSA partners and shall not be used, duplicated, modified or transmitted without their authorization Memorandum of Understanding 19071/05/NL/CP

---

universal mapping. There are two types of stimuli: chemical or ionic (salt and acid) or organic (sweet, bitter and umami). Two types of flavours are available: basic or secondary. The basic flavours are sour, sweet, bitter and umami (meaty taste similar to monosodium glutamate), the secondary flavours are combinations of the basic flavours. Some anomalies of flavour detection exist: loss of taste can be partial or total, permanent or temporary. Specific sites of taste are located on the upper surface of the tongue. Taste buds may be of four types: fungiform, filiform, foliate and circumvallate papillae. Temperature and certain substances such as spices, can influence the taste perception.

Olfaction is possible thanks to the ciliated receptor cells located in the nasal cavity. They react with molecules of a certain molecular weight ( $30 < MW < 300$ ) with a great diversity (mineral or organic). They reach the nasal cavity via two routes: the direct route and the path through the retronasal cavity. Aroma means the aroma sensory property perceptible by the olfactory organ through retronasal way during tasting and smell. The term is determined by direct sniffing volatile substances (AFNOR, 1991). The defects of perception called anosmia may be partial or total and permanent or temporary. There is also a close relationship between smell and gender (women have a more acute sense of smell than men). Other factors influencing the threshold for olfaction are: the substance, the duration of the activation of the stimulus or the air flow or quantity of molecules, ...

The receptors receive the information they send via nerve fibers. These are connected in series. This therefore allows to divide the sensory information into three or four floors before reaching consciousness.

When information is at the level of consciousness, it is processed more slowly than in the nerve fibers. This is only in this phase that we add hedonic connotation on quality and intensity. All messages take 0.1 to 0.2 seconds after receiving the stimulus. The subject then recalls, first, the hedonic rating, then the perceived quality and ultimately the intensity.

Only by learning to properly analyze the responses we get accurate and reproducible informations.

The sensorial perception is represented as a gross topographical information. Every sensation has a perceived quality and intensity which can be summarized roughly as a parabola graph. The perception of this sensation is integrated if the subject has already experienced it and if it is already stored.

### 3.3 Hedonism

AFNOR standards define hedonism as what relates to pleasant or unpleasant character (Greek = ‘delight’).

Hedonism holds a great place in consumer tests. Following the cultural background and personal experience of a subject, such hedonic reactions are unstable over time and varie from one subject to another. While some responses are innate in humans, habits can modify them. Instinctively humans try to relive positive experiences or otherwise, to avoid them.

The acceptability of new food is something hard due to the phenomenon of neophobia. This is the rejection of unfamiliar foods and can be circumvented by repeated contact with the food.

---

Some factors influence food preferences. These are cultural factors (regional patterns, religious traditions), economic factors (price, brand), individual factors that are either physiological (age, pregnancy, disease) or psychological (stress, eating disorder, climate). There is therefore intraindividual and interindividual variability. Consumer behavior is also highly variable.

## 3.4 Consumer testing.

They are very few publications and studies made on this subject. The objective of this test as part of this work is particular, it is to know the preferences and dislikes of consumers.

Looking through the literature, some information on the tests were taken in order to best meet the requirements of this work. Some properties from three different types of tests will be used. The recruitment of a sample of consumers must be representative spacially when the hedonic aspects of a product need particular attention,. They are asked to describe any product defects or evaluate the intensity of some of its characteristics. The goal is to determine what properties of the product are responsible for consumer preferences or aversions.

It is important to consider the situation in which the hedonic responses are obtained. This is why we try as much as possible to recreate the environment as natural as possible.

The three tests recommended are : in pairs, classification or hedonic evaluation.

The pairs test can compare two products on a sole criterion via the pleasant character or not.

The minimum number of products to be compared is four to five.

The classification tests are to classify the samples on the basis of their test by placing the most unpleasant on the left on a scale and the more pleasant to the right. This method is lighter for the experimenter but is more subjectifs for examinaters. A maximum of seven samples is recommended by evaluating pairs of products. Where possible, priority should be given the test in pairs over the classification test.

Hedonic tests are based on a randomised distribution. Individuals express their opinion about the pleasant character of a sample on a scale. The number of samples to be evaluated should be higher than seven. The advantage of these tests is that it is possible to use both new subjects who never did a sensory evaluation and experienced subjects. A maximum of twenty samples is presented in a different order for each subject to avoid order effects. It is often recommended to present again the first two samples at the end of the series and to submit a rating scale for each sample. The distance between the left bar (if the above is zero) and the mark made by the subject is then measured. This third test is most appropriate in the context of this work.

For each of these tests, it is desirable to have a sufficiently large group which will be (semi-) representative of the entire population.

Other tests can be intagrate in this work. These include aversions, fatigue, consumption (the goal of this test is the observation of consumer behavior).

## 4 ESTEC comments file

General comments issue 1 rev 0	
	The aim of the Technical note is to perform a trade-off of the menu elaboration approaches. That is provide different approaches and compare them on the basis of defined criteria. The comparison subsequently leads to the selection of the most appropriate approach. If the Technical note provides the menu elaboration approach selected, it however does not include a comparison with other possible approaches. Other possible approaches may have been looked at and discarded adequately, but this part of the work is not reported and is felt to be missing. Therefore a complete understanding of the presently proposed approach is precluded. It is however understood that it is a preliminary work, which will need further in depth analyses when more information on the ISS space food and MELiSSA crops is made available. To this respect, it is regretted that the critical points section of the document does not provide more details on the information needed to progress towards a complete elaboration of the menu. The technical note constitutes a basis of work for future development and will need to be re-assessed when new data are provided.
